DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

1. Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carmer et al. (# US 2002/0150678) in view of Hugelshofer et al. (# US 4436523).

Carmer et al. discloses a discharging ink (coating composition) for inkjet printing on cloth ([0151], [0155]) including a nonionic surfactant having HLB value of 6 to 15 ([0119]), a colorant ([0128]) and water ([0093]). They also disclose that the nonionic surfactant is an ethylene oxide adducts of halogenated phenol ([0119]) and amount of surfactant is from 0.01 to 20% by weight ([0120]).

Carmer et al. differs from the claim of the present invention is that the in comprises ethylene oxide and guanidine weak acid salt.

Hugelshofer et al. teaches that to have an ink with an excellent storage stability, the ink composition having ethylene oxide (column: 3, line: 45-65) and guanidine weak acid salt (column: 4, line: 1-15). They also disclose that the guanidine weak salt is from 0.1 to 5% by weight (see Examples).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the ink composition (coating composition) of Carmer et al. by the

aforementioned teaching of Hugelshofer et al. in order to have an excellent storage stability ink composition.

2. Claims 5-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carmer et al. (# US 2002/0150678) in view of Hugelshofer et al. (# US 4436523).

Carmer et al. discloses a process for preparing discharged polyester fiber cloth (synthetic fiber) ([0151]), which comprises a step of injecting a discharging ink (coating composition) for inkjet printing on cloth ([0151], [0155]) including a nonionic surfactant having HLB value of 6 to 15 ([0119]), a colorant ([0128]) and water ([0093]). They also disclose that step of wet heat treatment or dry heat treatment at 15 to 190 degree C, and step of soaping treatment ([0129]-[0133], [0157]-[0161]).

Carmer et al. differs from the claim of the present invention is that the in comprises ethylene oxide and guanidine weak acid salt.

Hugelshofer et al. teaches that to have an ink with an excellent storage stability, the ink composition having ethylene oxide (column: 3, line: 45-65) and guanidine weak acid salt (column: 4, line: 1-15). They also disclose that the guanidine weak salt is from 0.1 to 5% by weight (see Examples).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the ink composition (coating composition) of Carmer et al. by the aforementioned teaching of Hugelshofer et al. in order to have an excellent storage stability ink composition.
